Description

Flow cytometry is a process in which physical and/or chemical characteristics of biological or nonbiological particles are measured. In flow cytometry, single cells or particles are suspended in a fluid stream and then measured by passing through a beam of light. This allows simultaneous multiparametric analysis of the physical and/or chemical characteristics of up to thousands of particles per second. Flow cytometry is commonly used to test cells from bone marrow, lymph nodes, and blood samples. The test can identify the exact type of leukemia or lymphoma. It can also identify lymphomas from non-cancer diseases in the lymph nodes. The specimen samples may include cells from a biopsy, cytology or blood.

Cell-cycle analysis is a method using flow cytometry to distinguish cells in different phases of the cell cycle. Before analysis, the cells are permeabilized and treated with a fluorescent dye that stains DNA quantitatively. The fluorescence intensity of the stained cells at certain wavelengths correlate with the amount of DNA they contain. Cell-cycle anomalies can be symptoms for various kinds of cell damage, for example DNA damage, which cause the cell to interrupt the cell cycle to prevent transformation into a cancer cell.

Summary

Flow cytometry is routinely used in the diagnosis of health disorders by measuring antigens expressed on and within a cell through immunophenotyping. Immunophenotyping can be used to help diagnose and classify blood cancers and other diseases. For example, immunophenotyping panels can be used to distinguish chronic lymphocytic leukemia from a generalized increase of lymphocytes and to subclassify different chronic leukemias. Flow Cytometry is also used to distinguish acute lymphoid leukemia from acute myeloid leukemia. In individuals with multiple myeloma, flow cytometry is useful in minimal residual disease assessment. It is an effective tool in defining response in multiple myeloma. It was concluded that flow cytometry is a strong prognostic factor in minimal residual disease (Oliva 2021). Flow cytometric analysis of peripheral blood neutrophil myeloperoxidase expression is also used in ruling out myelodysplastic syndromes. It was concluded that flow cytometry analysis may prevent the need for bone marrow aspirate in individuals with suspected myelodysplastic syndromes (Raskovalova 2021). Also, other disorders such as HIV through analysis of surface antigens CD4 and CD8, can be clinically followed. For these reasons, the flow cytometry may be considered medically necessary for the indications described above.
