

# **HEALTH EQUITY REPORT**

2020 measure data stratified by Blue Cross Blue Shield of Massachusetts member-reported race and ethnicity data (when available), supplemented by imputed data using a multinomial logistic regression model that combines data from the RAND Bayesian Improved First Name, Surname, and Geocoding (BIFSG) method, the Massachusetts Immunization Information System (MIIS), and other member-level information (race/ethnicity data version 3).

As part of our commitment, each year we gather and publish data for more than 1.2 million of our commercial Massachusetts members, using measures widely leveraged by health plans and clinicians to monitor health care quality.

#### **CHRONIC CONDITIONS**

| Measure  | Asian   | Black   | Hispanic | White |
|--|---------|---------|----------|-------|
| Asthma Medication Ratio % of members with persistent asthma who took appropriate medications (age 5-64)  | 84.90%* | 70.80%* | 75.2%    | 78.4% |
| Comprehensive Diabetes Care – BP control % of adult diabetic members with blood pressure controlled (age 18-75)  | 84.9%   | 75.80%* | 80.50%*  | 84.6% |
| Comprehensive Diabetes Care – HbA1c poor control (lower rates indicate higher quality care) % of adult diabetic members with uncontrolled HbA1c (diabetes) (age 18-75) | 15.5%   | 23.20%* | 28.00%*  | 17.2% |
| Comprehensive Diabetes Care – HbA1c testing<br>% of adult diabetic members who had HbA1c (diabetes) testing<br>(age 18-75)   | 87.5%   | 84.80%* | 83.80%*  | 87.1% |
| Comprehensive Diabetes Care – retinal eye exam<br>% of adult diabetic members who had eye exams performed<br>(age 18-75)   | 58.2%   | 57.40%* | 54.50%*  | 59.6% |
| Controlling High Blood Pressure % of adult hypertensive members who keep their blood pressure controlled (age 18-85)   | 79.0%   | 69.80%* | 73.90%*  | 80.3% |
| Kidney Health Evaluation for Patients with Diabetes % of adult diabetic members who received a kidney health evaluation during the measurement year (age 18–85)        | 60.80%* | 59.50%* | 61.10%*  | 56.1% |

## **CHRONIC CONDITIONS**

| Measure   | Asian                | Black                | Hispanic             | White |
|---|----------------------|----------------------|----------------------|-------|
| Statin Therapy for Patients with Cardiovascular Disease –<br>Adherence 80%  | 84.3%                | 66.70%*              | 75.80%*              | 84.9% |
| % of adult members with cardiovascular disease who took their<br>statin medication at least 80% of the time (age 21-75 male,<br>age 40-75 female) |                      |                      |                      |       |
| Statin Therapy for Patients with Cardiovascular Disease –<br>Received Statin  | 92.60%*              | 86.8%                | 83.8%                | 88.4% |
| % of adult members with cardiovascular disease who took their<br>statin medication at least 80% of the time (age 21-75 male,<br>age 40-75 female) |                      |                      |                      |       |
| Statin Therapy for Patients with Diabetes – Adherence 80%   | 75.80%*              | 62.40%*              | 64.50%*              | 82.0% |

| Pharmacotherapy for Opioid Use Disorder   | Insufficient<br>Data | Insufficient<br>Data | Insufficient<br>Data | 34.5% |
| % of opioid use disorder treatments with adherence to a program for at least 180 days (age 16+)   | J 3.                 | <i>3.</i> - 3.       |                      |       |

#### **MENTAL HEALTH**

| Measure   | Asian                | Black | Hispanic | White |
|---|----------------------|-------|----------|-------|
| Risk of Continued Opioid Use – 15 days (lower rates indicate higher quality care)   | 2.20%*               | 3.8%  | 3.40%*   | 5.0%  |
| % of adult members with at least 15 days of prescription opioids in a 30-day period (age 18+)                                       |                      |       |          |       |
| Risk of Continued Opioid Use – 31 days (lower rates indicate higher quality care)   | 0.50%*               | 1.0%  | 0.50%*   | 1.5%  |
| % of adult members with at least 31 days of prescription opioids in a 62-day period (age 18+)                                       |                      |       |          |       |
| Use of Opioids at High Dosage (lower rates indicate higher quality care)  | Insufficient<br>Data | 4.6%  | 4.7%     | 5.8%  |
| % of adult members who received high-dose prescription opioids for<br>more than 15 days during a year (age 18+)                     |                      |       |          |       |
| Use of Opioids from Multiple Providers – Multiple Pharmacies (lower rates indicate higher quality care)                             | Insufficient<br>Data | 3.8%  | 1.7%     | 2.0%  |
| % of adult members who received prescription opioids from 4 or more pharmacies (age 18+)  |                      |       |          |       |
| Use of Opioids from Multiple Providers – Multiple Prescribers<br>(lower rates indicate higher quality care)                         | Insufficient<br>Data | 20.4% | 13.4%    | 17.8% |
| % of adult members who received prescription opioids from 4 or<br>more prescribers (age 18+)  |                      |       |          |       |
| Use of Opioids from Multiple Providers – Multiple Prescribers and<br>Multiple Pharmacies (lower rates indicate higher quality care) | Insufficient<br>Data | 2.3%  | 1.3%     | 1.1%  |
| % of adult members who received prescription opioids from 4 or<br>more providers and pharmacies (age 18+)                           |                      |       |          |       |

### OTHER TESTING AND TREATMENT

| Measure   | Asian   | Black   | Hispanic | White |
|---|---------|---------|----------|-------|
| Appropriate Testing for Pharyngitis % of incidents of pharyngitis (sore throat) that resulted in completion of appropriate testing (age 3+)   | 87.6%   | 83.20%* | 80.90%*  | 88.6% |
| Appropriate Treatment for Upper Respiratory Infection % of upper respiratory infections that did not involve an antibiotic prescription (age 3 months+)                             | 94.60%* | 95.70%* | 93.80%*  | 89.8% |
| Avoidance of Antibiotic Treatment for Acute Bronchitis/ Bronchiolitis  % of acute bronchitis/bronchiolitis episodes that did not involve an antibiotic prescription (age 3 months+) | 69.3%   | 78.20%* | 62.0%    | 64.4% |
| Use of Imaging Studies for Low Back Pain % of adult members diagnosed with low back pain who avoided unnecessary X-rays, CT scans, or MRIs (age 18-50)                              | 83.1%   | 85.8%   | 84.1%    | 83.6% |

#### **PREVENTION**

| Measure  | Asian   | Black   | Hispanic | White |
|--|---------|---------|----------|-------|
| Child and Adolescent Well-Care Visits  | 79.50%* | 63.40%* | 67.60%*  | 81.5% |
| % of child and adolescent members who had at least one comprehensive well-care visit with a PCP or OB/GYN (age 3-21) |         |         |          |       |
| Colorectal Cancer Screening  | 62.20%* | 59.10%* | 60.90%*  | 68.3% |
| % of adult members who had appropriate screening for colorectal cancer (age 50-75)                                   |         |         |          |       |
| Well-Child Visits for Age 15 Months-30 Months  | 94.20%* | 86.80%* | 92.50%*  | 96.6% |
| % of children who had at least 2 well-visits with a PCP (age 30 months)  |         |         |          |       |
| Well-Child Visits in the First 15 Months   | 91.00%* | 88.40%* | 90.00%*  | 94.2% |
| % of babies who had at least 6 well-visits with a PCP (age 15 months)  |         |         |          |       |

#### **WOMEN'S HEALTH**

| Measure   | Asian   | Black   | Hispanic | White |
|---|---------|---------|----------|-------|
| Breast Cancer Screening % of women who had at least one mammogram within the past 2 years (age 50-74)   | 76.10%* | 74.20%* | 77.20%*  | 79.9% |
| Cervical Cancer Screening % of women who were screened for cervical cancer using appropriate guidelines (age 21-64)   | 77.60%* | 77.30%* | 79.90%*  | 81.0% |
| Chlamydia Screening in Women % of women who were appropriately tested for chlamydia (age 16-24)   | 67.2%   | 74.50%* | 68.1%    | 66.4% |
| Non-Recommended Cervical Cancer Screening in Adolescent<br>Females (lower rates indicate higher quality care)<br>% of adolescent females who were screened unnecessarily for<br>cervical cancer (age 16-20) | 0.10%*  | 0.3%    | 0.3%     | 0.4%  |
| Severe Maternal Morbidity Rate (lower rates indicate higher quality care) % of childbirths with potentially life-threatening complications  | 2.7%    | 6.80%*  | 3.7%     | 2.7%  |
| Severe Maternal Morbidity Rate – Other Than Blood Transfusion (lower rates indicate higher quality care) % of childbirths with potentially life-threatening complications (other than blood transfusion)    | 1.4%    | 4.10%*  | 1.7%     | 1.2%  |

Race/ethnicity data version 3: The member race and ethnicity data underlying Blue Cross' analyses were a mix of self-reported data (approximately 14% of Blue Cross Blue Shield of Massachusetts members included in this report) and imputed data, which is a commonly used approach when self-reported data are incomplete. Imputed race and ethnicity were derived using a multinomial logistic regression model that combines data from the RAND Bayesian Improved First Name, Surname, and Geocoding (BIFSG) method, the Massachusetts Immunization Information System (MIIS), and other member-level information. More information about the RAND BIFSG method can be requested from: <a href="mailto:rand.org/health-care/tools-methods/bisg.html">rand.org/health-care/tools-methods/bisg.html</a>. More information about the MIIS data can be requested from: <a href="mass.gov/massachusetts-immunization-information-system-miis">mass.gov/massachusetts-immunization-information-system-miis</a>.

Analyses that include imputed data might overestimate or underestimate the true magnitude of inequities. For this reason, Blue Cross is currently engaged in a major effort to collect self-reported race and ethnicity data from members directly. Future versions of these analyses will incorporate more member self-reported race and ethnicity data as it becomes available.

We have assessed the accuracy of the imputed data in race/ethnicity data version 3 by comparing these data to the values reported by in-state members who have shared their self-reported race and ethnicity with Blue Cross..

|          | Sensitivity | Specificity | PPV   | NPV   |
|----------|-------------|-------------|-------|-------|
| Asian    | 95.1%       | 99.1%       | 90.9% | 99.5% |
| Black    | 81.2%       | 99.5%       | 83.1% | 99.4% |
| Hispanic | 74.8%       | 99.4%       | 87.7% | 98.5% |
| White    | 99.1%       | 81.9%       | 95.3% | 96.1% |

Abbreviations: PPV, positive predictive value; NPV, negative predictive value.

Note: Output probabilities from these imputation methods were categorized for these accuracy calculations; in the health equity report, the output probabilities (rather than their categorizations) from race/ethnicity data version 3 were used directly

\*Indicates when the inequity between minoritized racial and ethnic group (Asian, Black, Hispanic) members and White members is statistically significant (p < 0.05).

If you're a Blue Cross member, you can help improve the accuracy of these data right now, by updating your race, ethnicity, and language preferences <u>here</u>.

"Insufficient Data" indicates that there were fewer than 90 members of the indicated race and ethnicity who were included in the measure denominator (i.e., who had a condition or health event that caused the measure to apply to them). **Note**: We increased the minimum denominator from 50 to 90 members in this revision of the 2020 report, because a minimum of 90 members per cell is one of the many criteria we apply before measures can be considered in our pay-for-equity contracts with providers.

#### Learn more about the corresponding NCQA measures.

The Severe Maternal Morbidity rate among delivery hospitalizations is based on the CDC measure specification.

Due to the COVID-19 pandemic, for its provider incentive contracts Blue Cross Blue Shield of Massachusetts modified the specifications of three outcomes measures (Controlling High Blood Pressure, Comprehensive Diabetes Care — BP control, and Comprehensive Diabetes Care — HbA1c poor control) so that blood pressure and HbA1c values that were at goal in 2019 were carried forward into 2020 whenever no 2020 values were checked. This one-time 2020-only measure modification resulted in slightly better scores on these measures in 2020 than in 2019.

Note: The logic used to produce these HEDIS measure results has not been certified by NCQA. Such results are for reference only and are not an indication of measure validity. A calculated measure result (a "rate") from a HEDIS measure that has not been certified via NCQA's Measure Certification Program, and is based on unadjusted HEDIS specifications, may not be called a "Health Plan HEDIS rate" until it is audited and designated reportable by an NCQA-Certified HEDIS Compliance Auditor. Until such time, such measure rates shall be designated or referred to as "Uncertified, Unaudited Health Plan HEDIS Rates."
